**Plant Botanical Name:**

Glandularia tampensis

**Plant Threat Level:**

Endangered

*Glandularia tampensis,* endemic only to coastal areas of southern Florida, is endangered because of loss of habitat to development and agriculture. Very f intact in nature, and efforts are being made to protect habitat and to preserve germplasm from these remaining populations. To slow demand for wild-colle nurseries are propagating *Glandularia tampensis*. Although not common, it is becoming popular among native plant collectors and enthusiasts of butterfly
