

Plant Botanical Name:

Mammillaria hahniana

USBG Plant Location:

Conservatory

Conservatory Room Location:

World Deserts

Plant Threat Level:

Vulnerable

Mammillaria hahniana is commonly known as the old woman cactus because of the grayish hairs that protect it from the harsh sun common to its native habitat of Guanajuato. Mexico is an important center of diversity for the Cactus family, containing more than 500 species and possessing the highest number of endemic cacti of any country in the world. Though wild populations of *Mammillaria hahniana* are still considered vulnerable, widespread propagation of this species for catering to cactus hobbyists has greatly reduced the demand for plants illegally collected from naturally occurring populations.
